the present edition may be regarded as a descendant much changed and greatly enlarged of the late dr a d imms outlines of entomology first published in 1942 this went through three further editions without much change but after the death of the original author a fifth revised edition by professor o w richards and myself appeared in 1959 and a sixth in 1978 the book now appears in a considerably extended version in which i have tried to provide a more balanced introduction to the whole field of modern entomology by dealing with several aspects of the subject not discussed at all in previous editions thus in addition to innumerable lesser changes in the sections on insect structure function development classification and phylogeny i have completely recast the earlier chapter on some important modes of life in insects this now includes a far wider range of biological topics well exemplified by the insects and should i hope appeal not only to those already dedicated to entomology but also to others with more general biological interests a completely new chapter on the biology of insect populations has also been added and may serve to indicate the debt which modern ecological theory owes to work on insect populations it should hardly be necessary to apologize for introducing a certain amount of elementary mathematics into this account of a subject which is now among the most highly quantitative of biological disciplines
